KLZU runway and wind diagram. Schematic: alignment only. Magnetic north is up. Runway length, width, relative position and intersections are not drawn and are not published in the runway table. Land runways drawn: 07/25. Wind from 070 degrees true, 076 degrees magnetic, at 7 knots. Wind direction is the direction the wind blows FROM, so the arrow starts on the upwind side of the field and points across it. Wind-favoured runway end, highlighted: 07. Wind source: KLZU METAR 081256Z.

METAR — issued hourly. The SPECI report contains visibility, wind, and other conditions. KLZU observations describe the current state.

TAF — highest resolution. The NWS issues TAFs by aviation forecasters. TAFs describe conditions over a 24-hour period.

NWS hour — Weather Service hourly forecast. Includes sky cover, temperature, and other details.

NWS day/night — Weather Service day and night forecasts. Coarser than hourly but provides a broader view.

GFS M — the GFS model output. Twelve-hourly forecast. Coarser resolution than TAF.

GFS extended — the GFS model output. Short-range outlook. Published WPC surface chart matches this period.

GFA and — FAA NOTAM (NMS) — Notices to Air Missions: closures, outages, obstacles and TFRs, issued continuously by the FAA and valid until cancelled. On this page they are advisory evidence about the airport, not weather, and they never change a flight category. The NOTAM query failed this run (state: TRANSPORT_ERROR), so the NOTAM list is unknown rather than empty.

SHORT TERM

..
(Today through Wednesday)
Issued at 304 AM EDT Tue Sep 8 2026

A mid-level ridge covering most of the southern US will expand over North and Central GA today and create pleasant conditions. Subsidence from the ridge combined with a drier than normal airmass (PWAT values around 1-1.25") will lead to near zero rain chances across the area. Temperatures will rise into the upper 80s to low 90s across much of the area under partly cloudy skies and breezy easterly winds.

On Wednesday, the expansive mid-level ridge will start to split, with one part centering over the Southeast US. With the lingering dry airmass, rain chances will remain near zero across North GA. Across Central GA, some low-level moisture will start to push in from the southeast, supporting isolated to scattered afternoon showers and storms, primarily south and east of Macon. Temperatures will start to warm back up from our early week 'cool-down', with highs in the low to mid 90s under mostly sunny skies.

LONG TERM

..
(Wednesday night through Monday)
Issued at 304 AM EDT Tue Sep 8 2026

The mid-level ridge will begin to break down at the beginning of the long-term period on Thursday as a shortwave trough drops southeastward. This will bring a surface cold front southward into the Ohio Valley, serving to increase PoPs by late week as moisture interacts with the weak frontal boundary. This front now looks to become stationary farther to our north than previously favored, likely across the region from the Ohio Valley to Tennessee Valley Friday into the coming weekend. With deeper moisture pooling in advance of the front, expect elevated diurnally-enhanced rain chances through the weekend, and the potential for locally heavy rainfall may arise.

Any cooler and drier conditions will remain locked well to our north through the coming weekend. Highs will remain well above normal in the 90s through the week for most outside of the mountains. With dewpoints remaining near or above 70, heat index

values in the upper 90s to low 100s will, things will continue feeling decidedly summery for at least another week.

.LONG TERM...

(Wednesday night through Monday)

Issued at 304 AM EDT Tue Sep 8 2026

The mid-level ridge will begin to break down at the beginning of the long-term period on Thursday as a shortwave trough drops

southeastward. This will bring a surface cold front southward into the Ohio Valley, serving to increase PoPs by late week as moisture interacts with the weak frontal boundary. This front now looks to become stationary farther to our north than previously favored, likely across the region from the Ohio Valley to Tennessee Valley Friday into the coming weekend. With deeper moisture pooling in advance of the front, expect elevated diurnally-enhanced rain chances through the weekend, and the potential for locally heavy rainfall may arise.

Any cooler and drier conditions will remain locked well to our north through the coming weekend. Highs will remain well above normal in the 90s through the week for most outside of the mountains. With dewpoints remaining near or above 70, heat index values in the upper 90s to low 100s will, things will continue feeling decidedly summery for at least another week.

.AVIATION...
(12Z TAFS)
Issued at 607 AM EDT Tue Sep 8 2026

VFR conditions expected across most of the area through the period. SCT low-VFR CIGs of 3-5kft will gradually clear out through the morning hours, with some fair wx CU developing in the afternoon. Easterly winds will prevail at around 5-10kts through the period, with gusts of 18-20kts in the afternoon.

KAVL runway and wind diagram. Schematic: alignment only. Magnetic north is up. Runway length, width, relative position and intersections are not drawn and are not published in the runway table. Land runways drawn: 17/35. Wind from 170 degrees true, 177 degrees magnetic, at 3 knots. Wind direction is the direction the wind blows FROM, so the arrow starts on the upwind side of the field and points across it. Wind-favoured runway end, highlighted: 17. Wind source: KAVL METAR 081254Z.

The single value shown is the least favourable of those points; it is not a flight category because MEX published no ceiling or visibility for them.
- Predicted VFR from sky cover partly cloudy, 12 h thunderstorm probability 6%, 12 h precipitation probability 10%. This is a conservative prediction from the extended GFS MEX outlook, not a flight category: MEX publishes no ceiling or visibility. Verify day-of against a TAF or short-range MOS.
- Rough outlook — a single value for the whole day from the GFS extended MOS (MEX), which steps in twelve-hour intervals. MEX published no ceiling or visibility here, so this is sky cover, precipitation probability, wind and temperature only: it is not a flight category, is not a resolved forecast, and is never shown with the weight of one. Where those fields are usable a conservative “(Predicted)” value is shown alongside — still a prediction, not a flight category.

KSAV runway and wind diagram. Schematic: alignment only. Magnetic north is up. Runway length, width, relative position and intersections are not drawn and are not published in the runway table. Land runways drawn: 10/28, 01/19. Wind from 040 degrees true, 047 degrees magnetic, at 12 knots. Wind direction is the direction the wind blows FROM, so the arrow starts on the upwind side of the field and points across it. Wind-favoured runway end, highlighted: 01. Wind source: KSAV METAR 081253Z.

Evidence & limitations

- METAR source state: ok; observed Sep 8 08:53 ET; retrieved Sep 8 10:33 ET; 100 min before this run.
- Measured values read from the KSAV METAR. This is a current surface observation only; it is not a forecast.
- Only fields decoded from this METAR are shown; every missing field remains unavailable.
- Altimeter: 30.16 inHg.
- The complete raw METAR remains in this airport's Raw products disclosure.
- The runway schematic is alignment-only; verify current runway use and NOTAMs.

- Predicted MVFR from sky cover partly cloudy, 12 h thunderstorm probability 41%, 12 h precipitation probability 44%. This is a conservative prediction from the extended GFS MEX outlook, not a flight category: MEX publishes no ceiling or visibility. Verify day-of against a TAF or short-range MOS.
- Rough outlook — a single value for the whole day from the GFS extended MOS (MEX), which steps in twelve-hour intervals. MEX published no ceiling or visibility here, so this is sky cover, precipitation probability, wind and temperature only: it is not a flight category, is not a resolved forecast, and is never shown with the weight of one. Where those fields are usable a conservative “(Predicted)” value is shown alongside — still a prediction, not a flight category.

- Predicted MVFR from sky cover ovc, 12 h thunderstorm probability 45%, 12 h precipitation probability 52%. This is a conservative prediction from the extended GFS MEX outlook, not a flight category: MEX publishes no ceiling or visibility. Verify day-of against a TAF or short-range MOS.
- Rough outlook — a single value for the whole day from the GFS extended MOS (MEX), which steps in twelve-hour intervals. MEX published no ceiling or visibility here, so this is sky cover, precipitation probability, wind and temperature only: it is not a flight category, is not a resolved forecast, and is never shown with the weight of one. Where those fields are usable a conservative “(Predicted)” value is shown alongside — still a prediction, not a flight category.

Land runways drawn: 03/21. Wind from 040 degrees true, 048 degrees magnetic, at 10 knots. Wind direction is the direction the wind blows FROM, so the arrow starts on the upwind side of the field and points across it. Wind-favoured runway end, highlighted: 03. Wind source: KHxD METAR 081250Z.

The single value shown is the least favourable of those points; it is not a flight category because MEX published no ceiling or visibility for them.
- Predicted MVFR from sky cover ovc, 12 h thunderstorm probability 8%, 12 h precipitation probability 27%. This is a conservative prediction from the extended GFS MEX outlook, not a flight category: MEX publishes no ceiling or visibility. Verify day-of against a TAF or short-range MOS.
- Rough outlook — a single value for the whole day from the GFS extended MOS (MEX), which steps in twelve-hour intervals. MEX published no ceiling or visibility here, so this is sky cover, precipitation probability, wind and temperature only: it is not a flight category, is not a resolved forecast, and is never shown with the weight of one. Where those fields are usable a conservative “(Predicted)” value is shown alongside — still a prediction, not a flight category.

KSGJ runway and wind diagram. Schematic: alignment only. Magnetic north is up. Runway length, width, relative position and intersections are not drawn and are not published in the runway table. Land runways drawn: 13/31, 06/24, 02/20. Seaplane water lanes (17W, 35W, 18W, 36W, 12W and 30W) are excluded from the diagram and are never marked as favoured. Wind from 060 degrees true, 067 degrees magnetic, at 6 knots. Wind direction is the direction the wind blows FROM, so the arrow starts on the upwind side of the field and points across it. Wind-favoured runway end, highlighted: 06. Wind source: KSGJ METAR 081240Z.

Evidence & limitations

- METAR source state: ok; observed Sep 8 08:40 ET; retrieved Sep 8 10:33 ET; 113 min before this run.

Predicted IFR from sky cover ovc, 12 h thunderstorm probability 37%, 12 h precipitation probability 61%. This is a conservative prediction from the extended GFS MEX outlook, not a flight category: MEX publishes no ceiling or visibility. Verify day-of against a TAF or short-range MOS.

Rough outlook — a single value for the whole day from the GFS extended MOS (MEX), which steps in twelve-hour intervals. MEX published no ceiling or visibility here, so this is sky cover, precipitation probability, wind and temperature only: it is not a flight category, is not a resolved forecast, and is never shown with the weight of one. Where those fields are usable a conservative “(Predicted)” value is shown alongside — still a prediction, not a flight category.

Evidence & limitations

• GFS extended MOS (MEX) · 2 published point(s) for this ET day · 08:00 ET sky ovc · PoP12 44% · TS12 41% · wind 5 kt · 77°F; 20:00 ET sky ovc · PoP12 63% · TS12 36% · wind 8 kt · 81°F. The single value shown is the least favourable of those points; it is not a flight category because MEX published no ceiling or visibility for them.

• Predicted IFR from sky cover ovc, 12 h thunderstorm probability 36%, 12 h precipitation probability 63%. This is a conservative prediction from the extended GFS MEX outlook, not a flight category: MEX publishes no ceiling or visibility. Verify day-of against a TAF or short-range MOS.

• Rough outlook — a single value for the whole day from the GFS extended MOS (MEX), which steps in twelve-hour intervals. MEX published no ceiling or visibility here, so this is sky cover, precipitation probability, wind and temperature only: it is not a flight category, is not a resolved forecast, and is never shown with the weight of one. Where those fields are usable a conservative “(Predicted)” value is shown alongside — still a prediction, not a flight category.

- GFS extended MOS (MEX) · 2 published point(s) for this ET day · 08:00 ET sky ovc · PoP12 40% · wind 4 kt · 73°F; 20:00 ET sky ovc · PoP12 48% · wind 7 kt · 80°F. The single value shown is the least favourable of those points; it is not a flight category because MEX published no ceiling or visibility for them.
- Predicted MVFR from sky cover ovc, 12 h precipitation probability 40%. This is a conservative prediction from the extended GFS MEX outlook, not a flight category: MEX publishes no ceiling or visibility. Verify day-of against a TAF or short-range MOS.
- Rough outlook — a single value for the whole day from the GFS extended MOS (MEX), which steps in twelve-hour intervals. MEX published no ceiling or visibility here, so this is sky cover, precipitation probability, wind and temperature only: it is not a flight category, is not a resolved forecast, and is never shown with the weight of one. Where those fields are usable a conservative “(Predicted)” value is shown alongside — still a prediction, not a flight category.

KPNS runway and wind diagram. Schematic: alignment only. Magnetic north is up. Runway length, width, relative position and intersections are not drawn and are not published in the runway table. Land runways drawn: 17/35, 08/26. Wind from 070 degrees true, 072 degrees magnetic, at 9 knots. Wind direction is the direction the wind blows FROM, so the arrow starts on the upwind side of the field and points across it. Wind-favoured runway end, highlighted: 08. Wind source: KPNS METAR 081253Z.

The single value shown is the least favourable of those points; it is not a flight category because MEX published no ceiling or visibility for them.
- Predicted IFR from sky cover ovc, 12 h thunderstorm probability 56%, 12 h precipitation probability 43%. This is a conservative prediction from the extended GFS MEX outlook, not a flight category: MEX publishes no ceiling or visibility. Verify day-of against a TAF or short-range MOS.
- Rough outlook — a single value for the whole day from the GFS extended MOS (MEX), which steps in twelve-hour intervals. MEX published no ceiling or visibility here, so this is sky cover, precipitation probability, wind and temperature only: it is not a flight category, is not a resolved forecast, and is never shown with the weight of one. Where those fields are usable a conservative “(Predicted)” value is shown alongside — still a prediction, not a flight category.

KDAB runway and wind diagram. Schematic: alignment only. Magnetic north is up. Runway length, width, relative position and intersections are not drawn and are not published in the runway table. Land runways drawn: 07L/25R, 16/34, 07R/25L. Wind from 100 degrees true, 107 degrees magnetic, at 4 knots. Wind direction is the direction the wind blows FROM, so the arrow starts on the upwind side of the field and points across it. Equally wind-favoured runway ends, highlighted: 07L and 07R. Wind source: KDAB METAR 081253Z.

Evidence & limitations

- METAR source state: ok; observed Sep 8 08:53 ET; retrieved Sep 8 10:33 ET; 100 min before this run.
- Measured values read from the KDAB METAR. This is a current surface observation only; it is not a forecast.
- Only fields decoded from this METAR are shown; every missing field remains unavailable.
- Altimeter: 30.06 inHg.
- The complete raw METAR remains in this airport's Raw products disclosure.
- The runway schematic is alignment-only; verify current runway use and NOTAMs.

GFS extended MOS (MEX) · 2 published point(s) for this ET day · 08:00 ET sky ovc · PoP12 46% · TS12 50% · wind 4 kt · 77°F; 20:00 ET sky ovc · PoP12 57% · TS12 38% · wind 7 kt · 81°F. The single value shown is the least favourable of those points; it is not a flight category because MEX published no ceiling or visibility for them.

Predicted IFR from sky cover ovc, 12 h thunderstorm probability 50%, 12 h precipitation probability 46%. This is a conservative prediction from the extended GFS MEX outlook, not a flight category: MEX publishes no ceiling or visibility. Verify day-of against a TAF or short-range MOS.

Rough outlook — a single value for the whole day from the GFS extended MOS (MEX), which steps in twelve-hour intervals. MEX published no ceiling or visibility here, so this is sky cover, precipitation probability, wind and temperature only: it is not a flight category, is not a resolved forecast, and is never shown with the weight of one. Where those fields are usable a conservative “(Predicted)” value is shown alongside — still a prediction, not a flight category.

The single value shown is the least favourable of those points; it is not a flight category because MEX published no ceiling or visibility for them.
- Predicted MVFR from sky cover ovc, 12 h thunderstorm probability 49%, 12 h precipitation probability 41%. This is a conservative prediction from the extended GFS MEX outlook, not a flight category: MEX publishes no ceiling or visibility. Verify day-of against a TAF or short-range MOS.
- Rough outlook — a single value for the whole day from the GFS extended MOS (MEX), which steps in twelve-hour intervals. MEX published no ceiling or visibility here, so this is sky cover, precipitation probability, wind and temperature only: it is not a flight category, is not a resolved forecast, and is never shown with the weight of one. Where those fields are usable a conservative “(Predicted)” value is shown alongside — still a prediction, not a flight category.

Evidence & limitations

• GFS extended MOS (MEX) · 2 published point(s) for this ET day · 08:00 ET sky partly cloudy · PoP12 41% · TS12 49% · wind 5 kt · 78°F; 20:00 ET sky ovc · PoP12 61% · TS12 35% · wind 8 kt · 82°F. The single value shown is the least favourable of those points; it is not a flight category because MEX published no ceiling or visibility for them.

• Predicted IFR from sky cover ovc, 12 h thunderstorm probability 35%, 12 h precipitation probability 61%. This is a conservative prediction from the extended GFS MEX outlook, not a flight category: MEX publishes no ceiling or visibility. Verify day-of against a TAF or short-range MOS.

• Rough outlook — a single value for the whole day from the GFS extended MOS (MEX), which steps in twelve-hour intervals. MEX published no ceiling or visibility here, so this is sky cover, precipitation probability, wind and temperature only: it is not a flight category, is not a resolved forecast, and is never shown with the weight of one. Where those fields are usable a conservative “(Predicted)” value is shown alongside — still a prediction, not a flight category.

Evidence & limitations

- GFS extended MOS (MEX) · 2 published point(s) for this ET day · 08:00 ET sky ovc · PoP12 23% · TS12 44% · wind 5 kt · 77°F; 20:00 ET sky partly cloudy · PoP12 34% · TS12 23% · wind 7 kt · 83°F. The single value shown is the least favourable of those points; it is not a flight category because MEX published no ceiling or visibility for them.
- Predicted MVFR from sky cover ovc, 12 h thunderstorm probability 44%, 12 h precipitation probability 23%. This is a conservative prediction from the extended GFS MEX outlook, not a flight category: MEX publishes no ceiling or visibility. Verify day-of against a TAF or short-range MOS.
- Rough outlook — a single value for the whole day from the GFS extended MOS (MEX), which steps in twelve-hour intervals. MEX published no ceiling or visibility here, so this is sky cover, precipitation probability, wind and temperature only: it is not a flight category, is not a resolved forecast, and is never shown with the weight of one. Where those fields are usable a conservative “(Predicted)” value is shown alongside — still a prediction, not a flight category.

rough outlook — a single value for the whole day from the GFS extended MOS (MEX), which steps in twelve-hour intervals. MEX published no ceiling or visibility here, so this is sky cover, precipitation probability, wind and temperature only: it is not a flight category, is not a resolved forecast, and is never shown with the weight of one. Where those fields are usable a conservative “(Predicted)” value is shown alongside — still a prediction, not a flight category.

KTPF runway and wind diagram. Schematic: alignment only. Magnetic north is up. Runway length, width, relative position and intersections are not drawn and are not published in the runway table. Land runways drawn: 04/22, 18/36. Wind from 080 degrees true, 086 degrees magnetic, at 6 knots. Wind direction is the direction the wind blows FROM, so the arrow starts on the upwind side of the field and points across it. Wind-favoured runway end, highlighted: 04. Wind source: KTPF METAR 081235Z.

- METAR source state: ok; observed Sep 8 08:35 ET; retrieved Sep 8 10:33 ET; 118 min before this run.
- Measured values read from the KTPF METAR. This is a current surface observation only; it is not a forecast.
- Only fields decoded from this METAR are shown; every missing field remains unavailable.
- Altimeter: 30.02 inHg.
- The complete raw METAR remains in this airport's Raw products disclosure.

KSRQ runway and wind diagram. Schematic: alignment only. Magnetic north is up. Runway length, width, relative position and intersections are not drawn and are not published in the runway table. Land runways drawn: 14/32, 04/22. Wind from 080 degrees true, 086 degrees magnetic, at 4 knots. Wind direction is the direction the wind blows FROM, so the arrow starts on the upwind side of the field and points across it. Wind-favoured runway end, highlighted: 04. Wind source: KSRQ METAR 081253Z.

KVNC runway and wind diagram. Schematic: alignment only. Magnetic north is up. Runway length, width, relative position and intersections are not drawn and are not published in the runway table. Land runways drawn: 13/31, 05/23. Wind from 100 degrees true, 106 degrees magnetic, at 3 knots. Wind direction is the direction the wind blows FROM, so the arrow starts on the upwind side of the field and points across it. Wind-favoured runway end, highlighted: 13. Wind source: KVNC METAR 081235Z.

Evidence & limitations

• GFS extended MOS (MEX) · 2 published point(s) for this ET day · 08:00 ET sky partly cloudy · PoP12 39% · wind 3 kt · 74°F; 20:00 ET sky ovc · PoP12 56% · wind 6 kt · 81°F. The single value shown is the least favourable of those points; it is not a flight category because MEX published no ceiling or visibility for them.

• Predicted MVFR from sky cover ovc, 12 h precipitation probability 56%. This is a conservative prediction from the extended GFS MEX outlook, not a flight category: MEX publishes no ceiling or visibility. Verify day-of against a TAF or short-range MOS.

• Rough outlook — a single value for the whole day from the GFS extended MOS (MEX), which steps in twelve-hour intervals. MEX published no ceiling or visibility here, so this is sky cover, precipitation probability, wind and temperature only: it is not a flight category, is not a resolved forecast, and is never shown with the weight of one. Where those fields are usable a conservative “(Predicted)” value is shown alongside — still a prediction, not a flight category.

KNEW runway and wind diagram. Schematic: alignment only. Magnetic north is up. Runway length, width, relative position and intersections are not drawn and are not published in the runway table. Land runways drawn: 18R/36L, 18L/36R, 09/27. Wind from 120 degrees true, 121 degrees magnetic, at 3 knots. Wind direction is the direction the wind blows FROM, so the arrow starts on the upwind side of the field and points across it. Wind-favoured runway end, highlighted: 09. Wind source: KNEW METAR 081253Z.

Evidence & limitations

• METAR source state: ok; observed Sep 8 08:53 ET; retrieved Sep 8 10:33 ET; 100 min before this run.

• Measured values read from the KNEW METAR. This is a current surface observation only; it is not a forecast.

• Only fields decoded from this METAR are shown; every missing field remains unavailable.

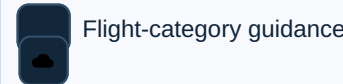

• Altimeter: 30.07 inHg.

• The complete raw METAR remains in this airport's Raw products disclosure.

• The runway schematic is alignment-only; verify current runway use and NOTAMs.

- Rough outlook — a single value for the whole day from the GFS extended MOS (MEX), which steps in twelve-hour intervals. MEX published no ceiling or visibility here, so this is sky cover, precipitation probability, wind and temperature only: it is not a flight category, is not a resolved forecast, and is never shown with the weight of one. Where those fields are usable a conservative “(Predicted)” value is shown alongside — still a prediction, not a flight category.

- GFS extended MOS (MEX) · 2 published point(s) for this ET day · 08:00 ET sky partly cloudy · PoP12 18% · TS12 70% · wind 6 kt · 83°F; 20:00 ET sky partly cloudy · PoP12 32% · TS12 26% · wind 9 kt · 84°F. The single value shown is the least favourable of those points; it is not a flight category because MEX published no ceiling or visibility for them.
- Predicted IFR from sky cover partly cloudy, 12 h thunderstorm probability 70%, 12 h precipitation probability 18%. This is a conservative prediction from the extended GFS MEX outlook, not a flight category: MEX publishes no ceiling or visibility. Verify day-of against a TAF or short-range MOS.
- Rough outlook — a single value for the whole day from the GFS extended MOS (MEX), which steps in twelve-hour intervals. MEX published no ceiling or visibility here, so this is sky cover, precipitation probability, wind and temperature only: it is not a flight category, is not a resolved forecast, and is never shown with the weight of one. Where those fields are usable a conservative “(Predicted)” value is shown alongside — still a prediction, not a flight category.

KHPN runway and wind diagram. Schematic: alignment only. Magnetic north is up. Runway length, width, relative position and intersections are not drawn and are not published in the runway table. Land runways drawn: 16/34, 11/29. Wind from 320 degrees true, 333 degrees magnetic, at 5 knots. Wind direction is the direction the wind blows FROM, so the arrow starts on the upwind side of the field and points across it. Wind-favoured runway end, highlighted: 34. Wind source: KHPN METAR 081256Z.

Evidence & limitations

- METAR source state: ok; observed Sep 8 08:56 ET; retrieved Sep 8 10:33 ET; 97 min before this run.
- Measured values read from the KHPN METAR. This is a current surface observation only; it is not a forecast.
- Only fields decoded from this METAR are shown; every missing field remains unavailable.
- Altimeter: 30.24 inHg.
- The complete raw METAR remains in this airport's Raw products disclosure.
- The runway schematic is alignment-only; verify current runway use and NOTAMs.

- Rough outlook — a single value for the whole day from the GFS extended MOS (MEX), which steps in twelve-hour intervals. The single value shown is the least favourable of those points; it is not a flight category because MEX published no ceiling or visibility for them.
- Predicted VFR from sky cover clear, 12 h thunderstorm probability 0%, 12 h precipitation probability 7%. This is a conservative prediction from the extended GFS MEX outlook, not a flight category: MEX publishes no ceiling or visibility. Verify day-of against a TAF or short-range MOS.
- Rough outlook — a single value for the whole day from the GFS extended MOS (MEX), which steps in twelve-hour intervals. MEX published no ceiling or visibility here, so this is sky cover, precipitation probability, wind and temperature only: it is not a flight category, is not a resolved forecast, and is never shown with the weight of one. Where those fields are usable a conservative “(Predicted)” value is shown alongside — still a prediction, not a flight category.

3 · Hazard feeds & regional observations

Unfiltered hazard feeds (not route-geometry screened): 10 SIGMET records, 29 G-AIRMET records, 3 CWA records. Regional current observations (not corridor forecasts): Mountain: IFR/LIFR at KAVL; Atlantic South: category unavailable at KFIN; Gulf East: MVFR at KSPG, KTPF.

Scope: Hazard counts are raw feed totals and have not been filtered against a proposed route, altitude, or time. Airport flight categories are current point observations, not corridor forecasts.

4 · Planning gates

- **Evidence gate:** an unavailable, stale, or out-of-horizon source is unknown — never treat it as favorable.
- **Weather gate:** compare current observations and valid-period forecasts with personal ceiling, visibility, convection, wind, and crosswind minimums.
- **Route gate:** screen the actual route, altitude, and time against official hazard products; feed totals on this page are not route-filtered.
- **Operations gate:** verify NOTAMs, TFRs, runway conditions, fuel, aircraft performance, daylight, and alternates.

5 · ForeFlight manual cross-check (before flight)

- Official briefing matches these go/no-go windows
- Prog charts / radar / satellite trend agrees with convection timing
- Winds & temps aloft along actual route (may shift ETE)
- **NOTAMs & TFRs** — airport-scoped NMS records may be shown, but route-wide/TFR coverage is not included; pull a fresh official briefing for departure, destination, and alternates
- Runway condition / length / closures at destination & alternate
- Weight & balance + performance at forecast density altitude (heat!)
- File & brief in ForeFlight; confirm fuel stops if long-range

Executive summary

FACTS BY CODE · GROUPING BY MODEL · NO MODEL-WRITTEN FACT

A plain restatement of evidence shown in full below. Every fact here was computed by code and is quoted exactly as code wrote it; a model was allowed only to group those facts and join them with connecting words. It reports what the sources say; it does not rank the days, rate them, or make a go/no-go call. The full five-part evidence follows underneath.

- Data quality is OK, as the page header badge reports; it gates publication and is not a weather statement. This restates evidence shown in full below; it is not a recommendation, not an all-clear, and not a data outage. The decision surfaces are the planning gates and the ForeFlight cross-check.

- Trip-window feasibility evidence (Derived): 0 of 4 active trip days carry a forecast flight category and 4 carry none. This is a derivation about how much evidence exists, not a go/no-go call and not a flight category. Trip window: Fri Sep 11 – Mon Sep 14, 2026. “This weekend” is taken to mean exactly this window; no other date range is assessed.
- A forecast flight category is available for 0 of 4 active trip days; 4 reach no category-capable product at this lead time. 0 of 29 covered destinations resolve a forecast flight category this run. This is coverage, not a ranking.
- KLZU current observation: VFR — conditions now, not a trip day. 42 hazard areas retained a coordinate ring this run, 0 of them valid inside the trip window, by the geometric test named below. KLZU NOTAM query state is TRANSPORT_ERROR, so no new-NOTAM count is stated; an incomplete query is not the same as none.

Full evidence, unchanged: the five parts in the owner's order

1 • Feasibility evidence for the trip window

This part is a derivation, not an observation: it states how much of the trip window carries a forecast flight category, and nothing more. It is not a go/no-go call, not a recommendation, and not a flight category. Its inputs and its gaps are listed in the tooltip on the line below.

- Trip window: Fri Sep 11 – Mon Sep 14, 2026. “This weekend” is taken to mean exactly this window; no other date range is assessed.
- Trip-window feasibility evidence (Derived): not assessable from forecast categories — 0 of 4 active trip days in Fri Sep 11 – Mon Sep 14, 2026 carry a forecast flight category and 4 carry none. This is a derived statement about how much evidence exists, it is not a flight category, and it says nothing about whether a flight is advisable. Every input and every gap is named in this line's tooltip.

2 • KLZU home-base status

The KLZU observation and the per-day board categories, taken from the same helpers the board itself renders from, so the two cannot disagree.

- KLZU current observation: VFR — from the surface observation read this run; it describes conditions now, not a trip day.
- Fri Sep 11, 06:00–22:00 ET: no flight category at this lead time — no product permitted to state one reaches this day (medium-low confidence).
- Sat Sep 12, 06:00–22:00 ET: no flight category at this lead time — no product permitted to state one reaches this day (medium-low confidence).
- Sun Sep 13, 06:00–22:00 ET: no flight category at this lead time — no product permitted to state one reaches this day (medium-low confidence).
- Mon Sep 14, 06:00–22:00 ET: no flight category at this lead time — no product permitted to state one reaches this day (medium-low confidence).
- A forecast flight category is available for 0 of 4 active trip days; 4 reach no category-capable product at this lead time.
- Data quality: OK — as reported by the badge in the page header; it gates publication, it is not a weather statement.

3 • Destination coverage

Coverage, not a pick: this counts which destinations a product permitted to state a flight category actually reaches. It is not a ranking, not a recommendation, and the editorial order of the destination list is not a flyability score.

- Destinations: 0 of 29 covered airports resolve a forecast flight category on at least one active trip day; 29 resolve none at this lead time. Counted from the same per-day outlook the destination cards render, with outlook-grade blocks excluded.
- No covered airport resolves a forecast flight category on an active trip day in this run, so no per-airport category is listed. That is the honest answer at this lead time, not a statement that the airports are unusable.
- NOTAMs: no destination of 29 reports an active NOTAM this run; 29 destination NOTAM queries did not complete. KLZU departure NOTAM state: TRANSPORT_ERROR.

4 • Weather events by area or region

Weather events by area or region, from products that carry an area. Per-airport categories are never clustered into a region here: an area inferred that way would be a spatial claim no source made.

- 42 hazard areas retained with their own coordinate rings. Each is related to an airport only by point-in-polygon (ray casting) against the product's own coordinate ring, or by great-circle distance from the airport to the nearest point on the product's boundary within 100 NM — tested against 29 airports that reported a position this run. No area name is inferred: the only names stated are the ones a product supplies itself. Per-airport categories are never clustered into a region.
- None of the 42 retained hazard areas is valid inside the planned trip window. SIGMETs, G-AIRMETs and CWAs are short-fuse products, so what follows describes conditions now and in the next few hours — it is not a forecast for the trip, and it must not be read as one.
- G-AIRMET ZULU — ICE: contains KBED (point-in-polygon (ray casting) against the product's own coordinate ring); boundary within 100 NM of KHPN 74 NM. valid 2026-09-08 12:46Z to 2026-09-08 15:00Z.
- G-AIRMET SIERRA — MT_OBSC: contains KTRI, KROA (point-in-polygon (ray casting) against the product's own coordinate ring); boundary within 100 NM of KSHD 39 NM, KAVL 60 NM, KGKT 65 NM. valid 2026-09-08 11:20Z to 2026-09-08 15:00Z.

- 30 of 42 retained hazard areas could not be related to any airport this page covers, by either test. They remain national-unfiltered: their geography is real but lies outside 100 NM of every airport tested, and nothing is claimed about where they are.
- Hazard feed record counts this run, unfiltered and national: SIGMET 10, G-AIRMET 29, CWA 3; overall feed state ok; feed states — CWA: ok, G-AIRMET: ok, SIGMET: ok. These are totals over the whole feed, not a count near KLZU, not a count along any route, and not a route assessment.

5 • New KLZU NOTAMs

This run keeps no snapshot of the previous run, so “new” cannot mean “changed since last time”. It is defined below as an FAA-published timestamp window, and the service-status scan reads the published text of every KLZU record so a status embedded inside a record of another category is not missed.

- Baseline for “new”: a KLZU NOTAM whose own FAA-published timestamp (last update, else issue, else effective start) falls within the 72 hours before this run's generation time (2026-09-08T14:33:25.722507+00:00). This run holds no copy of the previous run's NOTAM set, so this is a source-timestamp window and not a difference against an earlier run.
- KLZU NOTAM query state is TRANSPORT_ERROR, so this run does not know the KLZU NOTAM picture. No new NOTAM count is stated: an incomplete query is not the same as no NOTAMs.

This restates evidence; it is not a recommendation, not an all-clear, and not a data outage. The decision surfaces are the planning gates and the ForeFlight cross-check below, read against the KLZU board and destination cards. Every line above restates a value shown elsewhere on this page.
